

WHEN THE AGENT ACTS

Who owns the decision?

AI agent accountability: the gap most teams have not closed.

01

THE SHIFT

It doesn't advise. It acts.

When a system only advised, a human owned the decision.
When the agent acts, the decision leaves the room, and the ownership goes with it.

02

THE GAP

"The team" owns it means nobody does.

Ask who owns the agent's 2am action. If the answer is the team, an outcome owned by everyone is owned by no one.

03

NOT NEW

Unowned automation in new clothes.

The script that scaled the cluster always needed an owner who got the call. Agents make the question louder, not different.

04

THE MODEL

Approve by blast radius.

Low blast radius: open the gate, act, log, review later. High blast radius: the gate stays human, the agent prepares, a named person approves.

05

THE RULE

Automate the action, never the accountability.

Every autonomous action needs a named human owner before it is switched on. Not a team. A person who answers for it.

THE FULL ARGUMENT

Assign the owner before the agent acts.
